

Name: Reyes, Alexzander J.	Date Performed: 08/08/2025
Course/Section: CPE212-CPE31S2	Date Submitted: 08/08/2025
Instructor: Engr. Valenzuela	Semester and SY: 1st Sem & 2025-2026

Activity 1: Configure Network using Virtual Machines

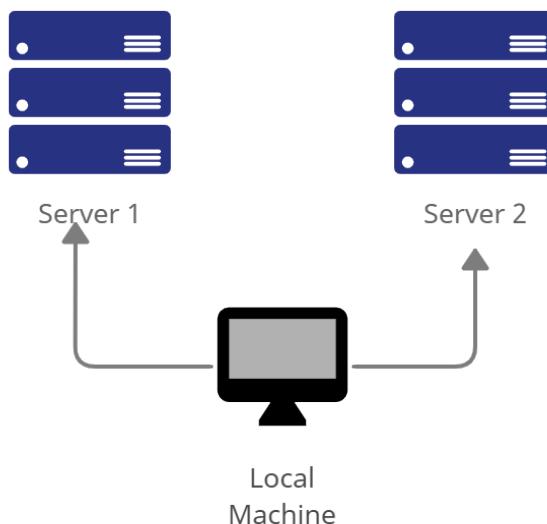

1. Objectives:

- 1.1 Create and configure Virtual Machines in Microsoft Azure or VirtualBox
- 1.2 Set-up a Virtual Network and Test Connectivity of VMs

2. Discussion:

Network Topology:

Assume that you have created the following network topology in Virtual Machines, **provide screenshots for each task**. (Note: *it is assumed that you have the prior knowledge of cloning and creating snapshots in a virtual machine*).

Task 1: Do the following on Server 1, Server 2, and Local Machine. In editing the file using nano command, press control + O to write out (save the file). Press enter when asked for the name of the file. Press control + X to end.

1. Change the hostname using the command **`sudo nano /etc/hostname`**
 - 1.1 Use `server1` for Server 1
 - 1.2 Use `server2` for Server 2
 - 1.3 Use `workstation` for the Local Machine

TASK 1
Server 1

```
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3          /etc/hostname

Server 1
```

Server 2

```
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3          /etc/hostname

Server 2
```

Local Machine

```
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3          /etc/hostname

Workstation
```

2. Edit the hosts using the command *sudo nano /etc/hosts*. Edit the second line.
 - 2.1 Type 127.0.0.1 server 1 for Server 1
 - 2.2 Type 127.0.0.1 server 2 for Server 2
 - 2.3 Type 127.0.0.1 workstation for the Local Machine

Server 1

```
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3           /etc/hosts

127.0.0.1      localhost
127.0.1.1      Server 1

# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

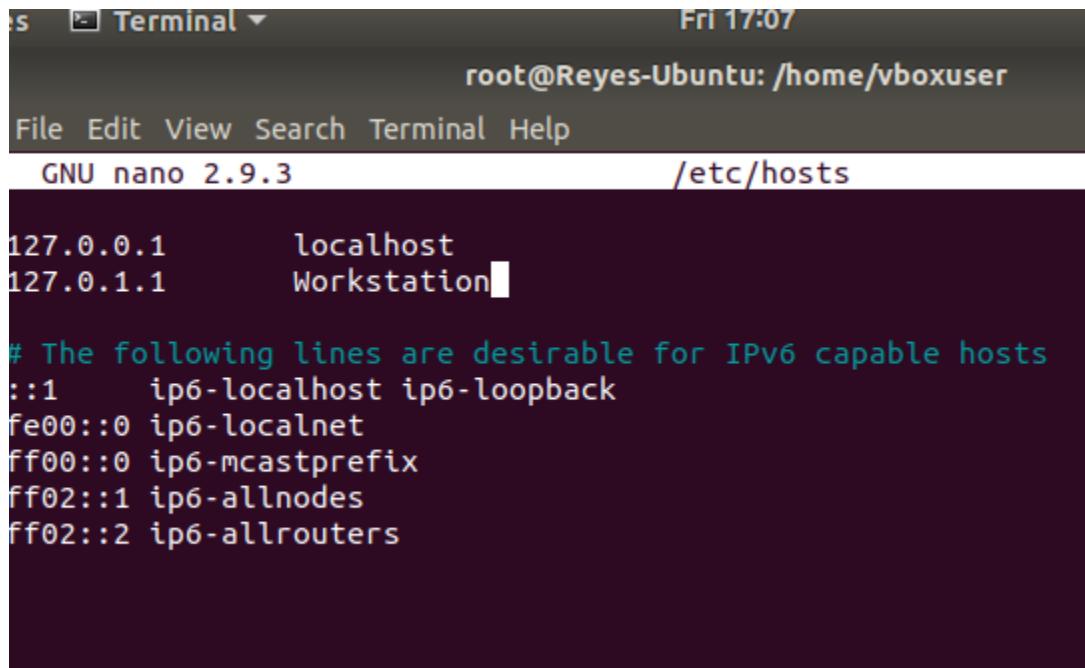

Server 2

```
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3           /etc/hosts

127.0.0.1      localhost
127.0.1.1      Server 2

# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

Local Machine

```
ls -l Terminal Fri 17:07
root@Reyes-Ubuntu: /home/vboxuser
File Edit View Search Terminal Help
GNU nano 2.9.3          /etc/hosts

127.0.0.1      localhost
127.0.1.1      Workstation

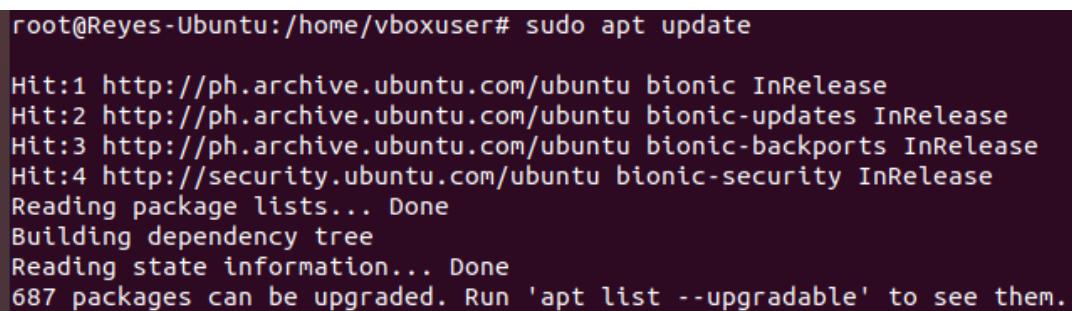

# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

Task 2: Configure SSH on Server 1, Server 2, and Local Machine. Do the following:

1. Upgrade the packages by issuing the command `sudo apt update` and `sudo apt upgrade` respectively.

`sudo apt update`

Server 1

```
root@Reyes-Ubuntu:/home/vboxuser# sudo apt update

Hit:1 http://ph.archive.ubuntu.com/ubuntu bionic InRelease
Hit:2 http://ph.archive.ubuntu.com/ubuntu bionic-updates InRelease
Hit:3 http://ph.archive.ubuntu.com/ubuntu bionic-backports InRelease
Hit:4 http://security.ubuntu.com/ubuntu bionic-security InRelease
Reading package lists... Done

root@Reyes-Ubuntu:/home/vboxuser# █
```

2. Install the SSH server using the command ***sudo apt install openssh-server***.
3. Verify if the SSH service has started by issuing the following commands:
 - 3.1 ***sudo service ssh start***
 - 3.2 ***sudo systemctl status ssh***
4. Configure the firewall to all port 22 by issuing the following commands:
 - 4.1 ***sudo ufw allow ssh***
 - 4.2 ***sudo ufw enable***
 - 4.3 ***sudo ufw status***

Task 3: Verify network settings on Server 1, Server 2, and Local Machine. On each device, do the following:

1. Record the ip address of Server 1, Server 2, and Local Machine. Issue the command *ifconfig* and check network settings. Note that the ip addresses of all the machines are in this network 192.168.56.XX.

1.1 Server 1 IP address: 192.168.56.105

```
enp0s8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.56.105  netmask 255.255.255.0  broadcast 192.168.56.255
        inet6 fe80::b89d:f659:2e49:6f37  prefixlen 64  scopeid 0x20<link>
          ether 08:00:27:ff:7a:a6  txqueuelen 1000  (Ethernet)
            RX packets 591  bytes 122757 (122.7 KB)
            RX errors 0  dropped 0  overruns 0  frame 0
            TX packets 157  bytes 21209 (21.2 KB)
            TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0
```

1.2 Server 2 IP address: 192.168.56.106

```
enp0s8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.56.106  netmask 255.255.255.0  broadcast 192.168.56.255
        inet6 fe80::5d54:dedb:e5c:e165  prefixlen 64  scopeid 0x20<link>
          ether 08:00:27:55:5e:bf  txqueuelen 1000  (Ethernet)
            RX packets 540  bytes 112953 (112.9 KB)
            RX errors 0  dropped 0  overruns 0  frame 0
            TX packets 161  bytes 21769 (21.7 KB)
            TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0
```

1.3 Server 3 IP address: 192.168.56.107

```
enp0s8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
        inet 192.168.56.107 netmask 255.255.255.0 broadcast 192.168.56.255
        inet6 fe80::b74a:baae:6b59:6e98 prefixlen 64 scopeid 0x20<link>
          ether 08:00:27:b7:2f:9b txqueuelen 1000 (Ethernet)
            RX packets 14 bytes 3992 (3.9 KB)
            RX errors 0 dropped 0 overruns 0 frame 0
            TX packets 62 bytes 7130 (7.1 KB)
            TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

2. Make sure that they can ping each other.

2.1 Connectivity test for Local Machine 1 to Server 1: Successful Not Successful

- **Successful**

```
vboxuser@Workstation:~$ ping 192.168.56.105
PING 192.168.56.105 (192.168.56.105) 56(84) bytes of data.

64 bytes from 192.168.56.106: icmp_seq=5 ttl=64 time=0.524 ms
```

Task 4: Verify SSH connectivity on Server 1, Server 2, and Local Machine.

1. On the Local Machine, issue the following commands:
 - 1.1 ssh username@ip_address_server1 for example, **ssh jvtaylor@192.168.56.120**
 - 1.2 Enter the password for server 1 when prompted
 - 1.3 Verify that you are in server 1. The user should be in this format user@server1.

For example, **jvtaylor@server1**

```
vboxuser@Workstation:~$ ssh vboxuser@192.168.56.105
vboxuser@192.168.56.105's password:

192.168.56.105 Server1
192.168.56.106 Server2
# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

5. On the local machine, verify that you can do the SSH command but this time, use the hostname instead of typing the IP address of the servers. For example, try to do **ssh jvtaylor@server1**. Enter the password when prompted. Verify that you have entered Server 1. Do the same for Server 2.

```
vboxuser@Workstation:~$ ssh vboxuser@server1
The authenticity of host 'server1 (192.168.56.105)' can't be established.
ECDSA key fingerprint is SHA256:ArVZ1Q92aBuZEIoWz3ZzkGt/vagzn4QGGpWwkOf1Y28.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'server1' (ECDSA) to the list of known hosts.
vboxuser@server1's password:
Welcome to Ubuntu 18.04.6 LTS (GNU/Linux 4.18.0-15-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/pro

Expanded Security Maintenance for Infrastructure is not enabled.

0 updates can be applied immediately.

Enable ESM Infra to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

New release '20.04.6 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

Your Hardware Enablement Stack (HWE) is supported until April 2023.
*** System restart required ***
Last login: Fri Aug  8 18:20:01 2025 from 192.168.56.107
```

```
vboxuser@Workstation:~$ ssh vboxuser@server2
The authenticity of host 'server2 (192.168.56.106)' can't be established.
ECDSA key fingerprint is SHA256:C0XnGfU9Y0aDpcl3ViiuyGgt5HuGqzVlCpxrsNNrIAk.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'server2' (ECDSA) to the list of known hosts.
vboxuser@server2's password:

Reflections:

Answer the following:

1. How are we able to use the hostname instead of IP address in SSH commands?
 - We are able to use the hostname instead of the IP address in SSH commands because of hostname resolution, which maps human-readable names to IP addresses. This can be configured locally using the /etc/hosts file, where specific IP addresses are manually assigned to hostnames. For example, adding a line like 192.168.56.107 server1 allows the system to recognize server1 as the IP address 192.168.56.108. This makes it easier to manage and remember machine names rather than numeric IPs. In larger networks, this is typically handled by a DNS (Domain Name System) server, which performs the same function automatically.
2. How secured is SSH?
 - SSH (Secure Shell) is considered very secure when properly configured, as it encrypts all data transmitted between the client and server, protecting it from interception and tampering. It supports multiple authentication methods, including passwords and public key authentication, with key-based login being more secure and commonly used in production environments. SSH also verifies the identity of the remote system, reducing the risk of man-in-the-middle attacks. Security can be further improved by disabling root login, restricting access via firewalls, changing the default port, and enforcing strong key or password policies.
